

Cover pages

The first page which is automatically added to each fax is called Cover Page. Its purpose is to display fax information such as the caller number, the called name, and so on.

Using Cover Pages

When the user sends a fax from the web portal or from Jabber client, he/she can choose the name of the cover page to be added before actual fax document, by clicking on a drop-down list in the "Fax Body" section.

When a user sends a fax through email, the cover page file is selected based on the "Fax: cover page name" user field. Enter here the cover page file name without extension.

If this field is blank the default cover page will be used (see below).

Managing Cover Pages

Coverpage location

Available cover pages are stored in different folders as cover files (*.cov):

- C:\Program Files (x86)\StonevoiceAS\Settings\Enterprise\Coverpages\ â **Public coverpages**
- C:\Program Files (x86)\StonevoiceAS\Settings\Departments\Department coverpages, where <X> is the first letter of the department (i.e. *StonevoiceAS\Settings\Departments\Sales\CoverPages*)
- C:\Program Files (x86)\StonevoiceAS\Settings\Users\Personal coverpages, where <X> is the first letter of relevant IAS username (i.e. *StonevoiceAS\Settings\Users\m\mary_quant_acme\CoverPages*)

Just add cover page files in any of above directories and the users will be able to use them in their faxes.

You can still find some default cover pages in the following system folder:

```
c:\ProgramData\Microsoft\Windows NT\MSFax\Common Coverpages\
```

Default cover page

The default cover page while sending faxes from email, from web portal or from Jabber Digital Fax gadget is NOCALLEDNUM.COV. This demo cover page includes an Imagicle logo, as shown in above screenshot.

If required, it is possible to assign a different cover page file as default. This is accomplished by editing the following settings file from Imagicle server's file system:

```
C:\Program Files (x86)\StonevoiceAS\Apps\Stonefax\Server\System\Stonefax.ini
```

- Under **[Settings]** statement, please add or amend (if already existing) the following line:

```
â DefaultCoverPage=<yourcover.COV>
```

where <yourcover.COV> is the actual cover file name of your choice.

If you want to disable the cover page, leave empty the value

```
â DefaultCoverPage=
```

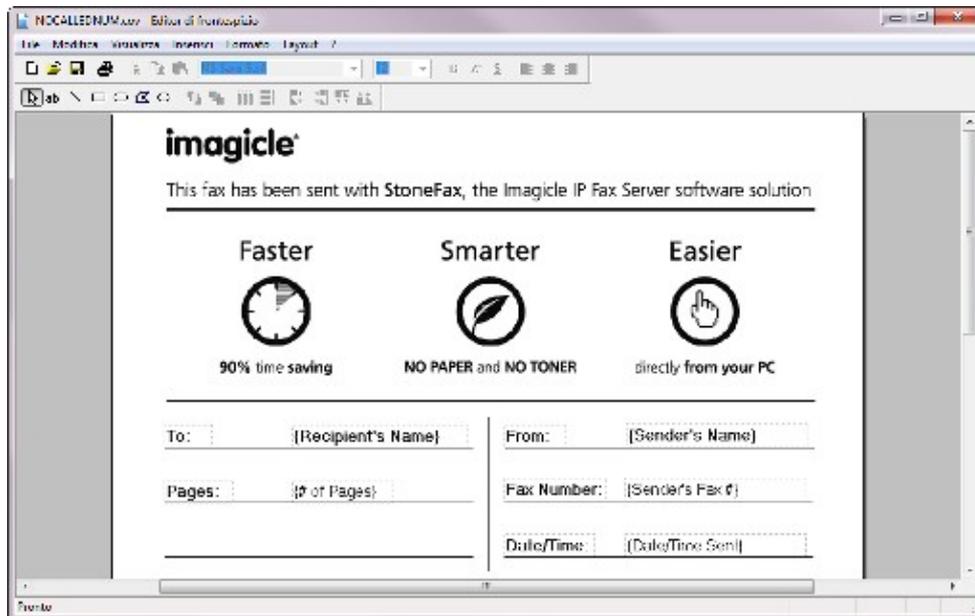

- Save file
- Restart StoneFax service

Design Your Own Cover Page

You can edit a cover page file by using FXSCOVER.EXE application, available in Imagicle server or in any Windows-based PC.

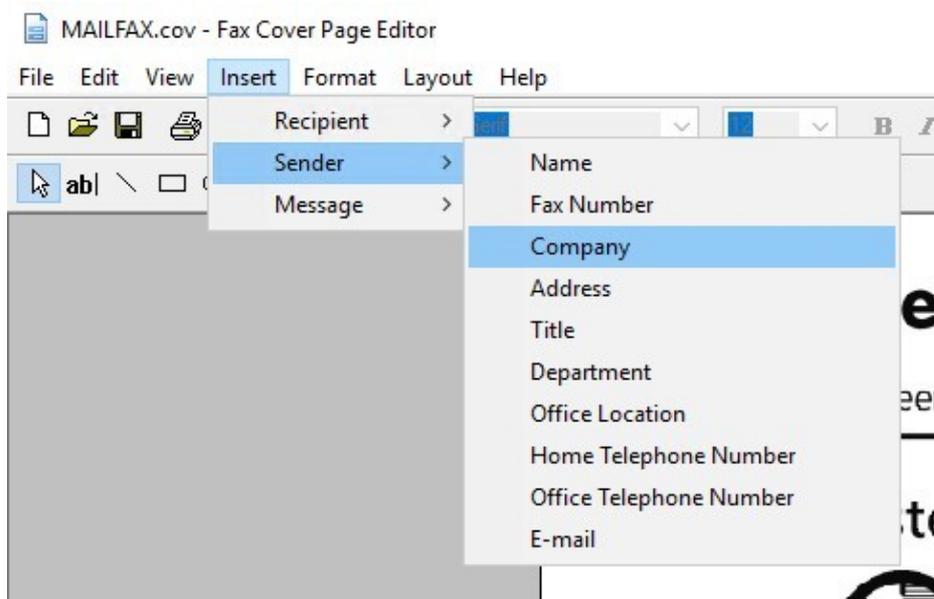

Warning: the .cov extension may not be associated with the cover editor. If you double click the cover page file and Windows asks you the program to use, you can locate FXSCOVER.exe in *C:\Windows\System32* folder. Or run "Windows Fax and Scan" on the Application Suite server.

If you delete all the cover files, the feature will be disabled and the users won't see the drop-down list with the names of the cover pages anymore.

In the fax coveragepage editor you can draw your own coverpage adding text, images (like logos) and some placeholders that will be valued with the fax specific data.

To add placeholders, just click on Insert and select the information you want to add:

See the following table for the list of supported placeholders and their possible values. Values indicated by "USER: " represent user properties as populated in the Imagicle suite user list:

Placeholder type	Placeholder name (in the coverage editor)	Placeholder tag	Value	Notes
Sender	Name	{Sender's Name}	USER: First and last name	
Sender	Fax Number	{Sender's Fax}	USER: Fax number	
Sender	Company	{Sender's Company}	USER: Company name	
Sender	Address	{Sender's Address}	USER: user address	
Sender	Title	{Sender's Title}	-	Not supported
Sender	Department	{Sender's Fax}	USER: Department	
Sender	Office Location	{Sender's Office Location}	USER: Office Location	
Sender	Home Telephone Number	{Sender's Home Telephone}	USER: Home phone	
Sender	Office Telephone Number	{Sender's Office Telephone}	USER: First Extension number	
Sender	E-mail	{Sender's E-mail}	USER: Email	
Recipient	Name	{Recipient's Name}	Recipient name specified at sending time	
Recipient	Fax Number	{Recipient's Fax}	Destination fax number specified at sending time	
Message	Note	{Note}	The textual note specified at sending time	See note below
Message	Subject	{Subject}	The fax subject specified at sending time	
Message	Date/Time Sent	{Date/Time Sent}	Fax transmission time	
Message	Number of pages	{# of Pages}	Tot. number of pages (including the coverage)	

Populating notes using mail2fax

When sending a fax via email (mail2fax feature) you can populate the coverage {Note} placeholder using the email body text. Please notice that only first 200 characters of the email body are considered (exceeding ones will be discarded).

To do that, you need to set in file StonevoiceAS\Apps\Stonefax\Server\System\Stonefax.ini the following parameters under the [Settings] section:

```
[Settings]
AlwaysPutFaxContentOnCover=1
OnHtmlRenderingPutBodyTextInCoverage=1
```

If this option is enabled and a coverage is not used, the outgoing fax will be attempted with attachments only (if there are no attachments, an error will be returned to the sending user).

Localized Cover Pages

In a multi language environment you may want the same cover page to be available in different languages and to be selected based on the sender user's language.

- Set the user language prefix in the User Management page
- Prepare one copy of the .cov file for each language in the root cover pages folder
- Name the files like this: <language prefix><underscore><cover page name>.cov
For example: en_urgent.cov, it_urgent.cov
- In the "Fax: cover page name" user field enter the name without prefix. E.g. "urgent.cov"
